David Strachman
McIntyre, Tate & Lynch, LLP
321 South Main Street, Suite 400
Providence, RI 02903

November 11, 2010

Dear Mr. Strachman,

In order to write this reports I reviewed a transcript of my testimony conducted July 15, 2002 before Magistrate Judge David L. Martin, relevant parts of the decision from the case (304 F.Supp.2d 232) and the report from Eileen P. Ryan, D.O., sent to Mr. Brian Hill on October 15, 2010.

After reviewing the transcript I stand by my testimony. The major focus of my testimony was the impact of parental loss on the children – both at the time of the loss and in the future. There are hundreds of studies in the psychological literature describing the unique and required “attachment” that children make with their parents, even before they are born. This attachment to a parent is crucial for children to develop normally – emotionally, socially and intellectually. When this attachment is broken children as young as 6 months show the beginnings of grief and mourning. The research strongly describes that abrupt and permanent separation of a child from a parent, or as in this case, two parents, results in significant and often extreme emotional distress. This can include being clingy, demanding, yearning for the parents’ return, angry protest and regressive behavior. There is no doubt or controversy in the literature regarding this issue. There is no doubt in my mind that the Ungar children experienced trauma when their father and their mother were murdered.

I also spoke in my testimony about the future impact that the death of the children’s father and mother may have on them. The children carry the loss of their father with them all the time, compounded by the loss of their mother. They were emotionally injured at a very young and delicate age. As a result they have a vulnerability to loss and are more susceptible to depression and anxiety in the future. Once again, the psychological literature discusses the impact of childhood loss on later adult development and emotional functioning.

The Ungar children are being raised by their maternal grandparents. Their grandparents are significantly older than their biological parents age and therefore

the children will sustain the loss of their surrogate parents at a much younger age than they would have had their father, and mother not been murdered.

Dr. Ryan, in her report, writes about a "forensic evaluation". Dr. Ryan criticized my testimony because I did not perform a "forensic evaluation". I never purported that I had conducted an extensive evaluation. Any evaluation is merely a snap shot of what is happening on that day and can only describe the psychological, emotional and cognitive functioning of a person at that particular time.

My testimony focused on the psychological impact and trauma experienced by the children as a result of the sudden separation from their father and mother. This is very difficult to quantify, especially years after the loss. As mentioned above I also testified that as a result of the death of their father, and mother, these children are more at risk for developing psychological problems in the future.

I will be charging \$200 an hour for the preparation of this report and testimony.

Attached is a copy of my CV.

Sincerely yours,

A handwritten signature in black ink that reads "Allan J. Brenman Ed.D." The signature is written in a cursive, flowing style.

Allan J. Brenman, Ed.D.
